SONOS ZP100 Network Card Replacement

Are you having trouble connecting your SONOS ZP100 to your network? The network card may be damaged and need replacement!

Written By: Adrian
INTRODUCTION

Be sure to power off and unplug your device before you begin your repair.

Follow this guide to swap the network card.

TOOLS:

- New Item (1)
- Metal Spudger (1)
- Tweezers (1)
- Spudger (1)
- 1 x Opening Picks (1)
Step 1 — SONOS ZP100 Network Card Replacement

- With the SONOS ZP100 (ZonePlayer) it is possible to use external speakers to play your music that is streamed to the Sonos ZP100 via WiFi or cable.

- The integrated amplifier delivers an output of 2 x 50 watts.

- With the Sonos S1 System App, the ZP100 can be operated via a smartphone or a computer.
Step 2 — Remove cover

- The upper cover is fastened with two retaining lugs on the front and two on the sides.
- On the rear side there are fixed brackets that cannot be pressed in.

Step 3

- Gently try to lift one side with a metal spudger. Make sure not to press in the retaining lug directly, as it can break off very easily.
- When you've lifted one side, use an Opening Pick to keep the lid from snapping back into place.
- Lift the lid up and out of its mounting towards the back.

Sharp-edged tools can cause scratches and leverage, which later remain visible on the device.
Step 4 — Remove the screws from the upper case

- Using the precision tweezers to remove the sticker in the center of the top chassis.
- Remove the three 35 mm Phillips screws and their washers that attach the top of the device to the bottom.

⚠ Even after removing the power plug, there may be dangerous charges on components in the device.

Step 5

- Now turn the device over so you can remove the screws on the bottom.
Step 6 — Remove the rubber feet

- Use a spudger to remove the four stuck-on rubber feet. If necessary, use some heat (iOpener / hair dryer) to be able to loosen the feet better.

Step 7 — Remove the base plate

- Remove the four 10 mm Phillips screws in the countersinks.
Step 8

- Lift the bottom lid up and set it aside. You will need it again.

⚠️ The two WiFi antennas are located on the underside. These can cause injury or break.

Step 9

- Remove the four 10 mm Phillips screws on the bottom.
Step 10

- For a better stand and to avoid damaging the antenna, put the lower cover back on and turn the device over.

Step 11 — Remove the upper case

- Lift the top lid straight up on both sides.
Step 12

- On the underside of the cover between the screws there are two heat conducting pads that transfer the heat generated from the board to the case.

These Pads are very important, be careful not to lose them. They can either stick to the lid or in the device.

Step 13 — Remove the WiFi card

- Press both tabs outwards with our fingernails.

- The card should pop up by itself.

- Pull out the card in the direction of the connector.

The WiFi card is still connected to the device with two cables. Be careful not to damage or tear them down.
Step 14

- Pull the 10-pin flat connector straight off towards the front of the device.

- Make sure to pull out the entire plug including all cables.

Step 15 — Loosen the screws on the network board

- Remove the four 7 mm Phillips screws securing the board to the case.
Step 16

- Lift the board up at an angle and pull it together with the Ethernet ports towards the front a little bit out of its fixing on the back.

- Carefully turn the board to the side.

⚠️ The board is still connected to the bottom with two cables. Be careful not to damage them.

Step 17

- Press the two tabs evenly away from the connector.
Step 18 — Disconnect the ribbon cable

- Gently pull the ribbon cable straight out of the connector toward the back.

Now you can turn the board further outwards and it is easier to get to the next connector.

Step 19

- Remove the power cable from the board. The plug is secured by a plastic tab. Push the nose away from the connector to pull it out.
Step 20 — Remove network card

- The network board is now completely separated from the amp board and the power supply.

Step 21 — Removing the ribbon cable

- Press the two tabs evenly away from the connector.

- Gently pull the ribbon cable to the Ethernet ports straight out of its connector on the board.
To reassemble your device, follow these instructions in reverse order.

- Front and back of the network card.
