Amazon Fire Stick 4k Remote Teardown

This guide is for the remote. It shows how to separate the case pieces and access the inside, then remove the motherboard to see all the parts.

INTRODUCTION

My remote had battery leakage damage. I attempted to disassemble to clean but prying was very forceful and I probably damaged it. Also, I found the battery damage was extensive inside.

TOOLS:

- metal pry tool (1)
- Phillips #0 Screwdriver (1)
- iOpener (1)
Step 1 — Heat the remote to loosen the glue.

- Heat it a lot if you are trying to maintain it in working order because it seems the glue on the clasps was very strong. I probably broke mine taking it apart (but it didn't work anyway so I don't know).

Step 2 — Pry it apart.

- It takes A LOT of force to pry this apart. I'm not sure it's possible without breaking the inside.
Step 3 — Remove the seven motherboard screws.

- Very easy to remove with the #0 phillips screwdriver.

Step 4 — Remove the motherboard and button pad.

- Once the screws are removed, all the pieces come out easily.
