Data rescue from an old computer

You can transfer hard drive data from a computer that has no USB port, no Firewire port, no Ethernet port or no CD burner or usable portable media device.

INTRODUCTION

Hard drive in old 486 PC contained data felt to be of importance. PC contained only a 3.5" floppy disk drive. "New" computer (Mac G4) did not contain floppy disk drive. Old PC had no modern data transfer ports. This guide offers one solution.
Step 1 — Data rescue from an old computer

- Problem: How to move HD data from an old 486 computer with no modern data transfer ports to a newer computer (i.e. Mac G4 tower).
  Solution: Remove hard drive from old PC and connect it to a drive adapter which can connect to the computer to which you want to move the data.

To reassemble your device, follow these instructions in reverse order.
