Step 1 — Removing Dell Inspiron 1150 RAM

- Turn the laptop so that the bottom is facing up.
- Locate the panel that has an M on it and two air vents.

Step 2

- Take the screw driver and carefully unscrew the screw that is located above the M in order to remove the panel.
-  Put this screw in a bag or easily identifiable place.
- Remove the panel.

Step 3

- After removing the panel, you will see two memory modules.
- Locate the four spring clips that are holding the memory modules in place.
- Place your thumb on each of the two spring clips for each memory module and push outward until the memory module pops up.
- Gently raise the memory module and lift it out of its socket.

To reassemble your device, follow these instructions in reverse order.
